

# COW DIRECT SOAKING

*PENETRATE THE HAIR TO COOL*

**LOW PRESSURE, LARGE DROPLET**

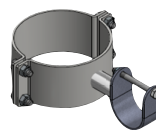

The **East Rock Cow Direct Soaking System** is an effective solution for managing heat stress in cows residing in barns and parlors. This system uses low-pressure, large-droplet water soakers to soak a cow's back and penetrate its hair, enabling evaporation and cooling when exposed to high airflow. To achieve optimal results, it is suggested to pair the soaker lines with an East Rock recirculation fan. The East Rock team is accessible to assist you in devising a soaking strategy that meets your requirements, such as identifying the appropriate temperature, frequency, and duration of soaking intervals.
