

LOOPS FOR STALLS

THE BEST OPTION FOR COWS

BUILT WITH COW COMFORT IN MIND

Our **East Rock Stall Dividers** are specially designed to prevent cows from turning around in their stalls. The top part is adjustable for shoulder bars, while the front remains open and unobstructed. In addition, there is a gentle slope from the high back to the low front, which helps cows maintain a straight position while they are resting.

These stalls are suitable for both single-row and head-to-head configurations. They provide a dry and comfortable area for dairy cattle to rest, which is crucial for their health, well-being, and performance. Properly designed freestalls can increase lying time, improve hygiene, and reduce injuries. This, in turn, helps maintain a healthy and productive herd.

FEATURES & BENEFITS

Horizontal Top:
Allows for Shoulder Bar Lengths adjustments without affecting the height.

High Cantilever:
Gives more space for the Cow's Pin Bones, thereby providing more space and comfortable rest.

Transition Drop:
Between the high back and low front this helps the cows to position themselves in a more straight lay down

Open Front:
Allows cows to take full advantage of their natural laying down and getting up behaviour.

Easier Exit:
A sloped top allows cows to turn sooner, thereby reducing the risk of bumping other cows behind them.

Recessed Loop:
To stop cows from hitting loops while walking by and from walking on the platform.

Low Side Lunge:
Allows cows for full 360 degrees head movement for sleeping, grooming and side Lunging.

AVAILABLE FOR BOTH MATURE AND YOUNG STOCK
